Immediate First Aid : Use of Blood, Guts, Wounds, and Bleeding.. Medical Billing and CodingÂ .Q: Why do the spacetime volume and energy of a bubble differ by factor of π ? This is a very basic question about the volume and energy of a spherical bubble of a gas, which has been asked before, but I don't have much of a grasp on how they come up with that result. Essentially, I want to understand how they get that the volume (measured by volume of the shell) is $\frac{4}{3}\pi R^3$, the average radius of the surface, the average radius of the volume, and the surface area of the shell, is $4\pi R^2$, the volume of the shell, the surface area of the shell, and volume of the fluid inside the shell. The energy of a sphere, as I understand it, is $\frac{4\pi}{3}R^3$, the energy of the sphere. Why is the ratio $\frac{4}{3}$? A: For the definition of the volume, you have to distinguish between an enclosed volume, and a surface integral. For example, in the case of a sphere, the enclosed volume is the volume of a sphere, and the surface integral is the integral over the surface of the sphere. So, the volume of a sphere, in general, is $\int dV = \int_S dS$ where S is the surface. The volume integral gives the change in the enclosed volume, and the surface integral gives the change in the surface. Since the surface integral gives a negative sign for a sphere, the enclosed volume must be a positive number. Therefore, $V = \frac{1}{3} \cdot \frac{4\pi}{3} \cdot R^3 + \frac{2}{3} \cdot \frac{4\pi}{3} \cdot R^2 \cdot \cos\theta$. For the definition of the energy of a sphere, it is the energy stored in the sphere, which is twice as much energy as the change in the energy of the sphere. For that case, the energy integral gives the change in the energy of the sphere,
